Work in Photoshop starts by creating an image in which the process of design begins. Each photo element, also known as a "pixel," holds an individual shade of color. A color is defined by a value or intensity, which can be adjusted subtly. The adjustments control the color's overall appearance, and most operations involve adding multiple color shades to a picture. For example, thin washes and gradations of color are created by adding color shades that add up in the final adjustment an image. The Adjustment Layers feature lets you view and change Photoshop layers at different stages in your editing workflow. You can change the opacity, blend mode, or effects of the layer before and after each photo is untouched by a layer. For example, you can start with an adjustment layer, discover that some areas are too dark, and then move it over to the next image. Later, you can make changes or work on any adjustments, and then move it back to the adjustment layer. This lets you make edits to your images in multiple steps. While Auto Color Correct is enabled, the **COLOR LUT <> PHOTO** controls appear in the Color panel palette. The Color LUT controls Photoshop's Color panel and lets you view your image in an RGB or HSB color space. With the Hue slider, you can adjust image's hue for a more muted or vibrant color. The Value slider varies

the brightness of the image — with **LOW** decreasing the amount of brightness, and **HIGH** increasing it. Opacity lets you adjust the image's transparency or opacity. The **GAMMA** slider adjusts the image's gamma value. 933d7f57e6
