What's New In Git-cola?

git-cola is an external interface to the Git version control system. The goal of git-cola is to improve productivity, by offering a graphical user interface to the basic Git functionality. The interface is fully compatible with normal git- commands and as such git-cola should be seen as a sort of "fallback" mode to deal with low-level tasks that need to be done from the command line. git-cola Details: Signed-off-by: Wim Leers vim: et ts=4 sw=4 Log message: git-cola: added a --no-program option, so that it is possible to run git cola without it starting a new git process Log message: git-cola: added a --no-program option, so that it is possible to run git cola without it starting a new git process Signed-off-by: Wim Leers Log message: git-cola: updated executable to also work for executable git-cola, because Windows does not allow --program Log message: git-cola: updated executable to also work for executable git-cola, because Windows does not allow --program Signed-off-by: Wim Leers Log message: git-cola: fixed problem where git-cola would cause a git process to be started and not killed by the shell Log message: git-cola: fixed problem where git-cola would cause a git process to be started and not killed by the shell Signed-off-by: Wim Leers Log message: git-cola: added more documentation about the config file Log message: git-cola: added more documentation about the config file Log message: git-cola: added more documentation about the config file Log message: git-cola: added more documentation about the config file Signed-off-by: Wim Leers Log message: git-cola: updated documentation about the command-line tool, because it is now possible to make it executable Log message: git-cola: updated documentation about the command-line tool, because it is now possible to
